ON-PREMISES DEPLOYMENT OPTIONS

RamSoft
GLOBAL IMAGING DELIVERED

While RamSoft fully believes in a cloud future, we understand that some of our customers have a large IT infrastructure base or are simply not ready to move to the cloud. For this reason, RamSoft provides a full suite of on-premises deployment options which could be customer-managed, RamSoft managed, or a mixed offering. RamSoft's on-premises offering is built around Microsoft's Hyper-V technology.

SINGLE NODE WITH CLOUD BACKUP	A local PowerServer™ is built out at your location. This entry-level on-premises option offers automated replication of all medical data to a secure Microsoft account.
MULTI NODE	Two instances of PowerServer™ can be configured to automatically replicate data between them. This model ensures a second instance of your data to exist whether at the same location or an alternate.
ADVANCED CUSTOM OFFERINGS	If you already have a full IT staff base and infrastructure, RamSoft can work with your team to provide custom solutions to maximize what you have. Our on-premises platform is built on virtualized OS infrastructure making it highly flexible and customizable.
ON-PREMISES DEPLOYMENT BACKUPS	RamSoft strives to ensure that your critical data is always protected. All on-premises deployment models mandate at least a primary and secondary storage location. PowerServer™ is also fully compatible with Hyper-V and VMware architectures, so any backup or replication technologies your IT staff utilizes to manage such environments can be used to manage PowerServer™ as well. RamSoft technicians can provide guidance in this area.
